

New Post Page

This task provides you with experience in React States and React Hooks to incorporate dynamic user-interfaces into your DEV@Deakin web platform.

Complete the following:

1. Complete the Task Requirements.
2. You will find “Topic Videos and Demo Videos” of Week 3 - 5 on the SIT313 CloudDeakin site particularly useful as a reference for this task.
3. Create a new [GitLab](#) repository for this task. Ensure all files/resources created are committed to this repository.
4. Create a 2 – 4 minute video where you provide a walkthrough of your code and solution, demonstrating your understanding of the concepts. Upload your video to [Panopto](#).
5. Create a short report that includes:
 - a. Screenshots of your DEV@Deakin web platform.
 - b. A link to your task repository on GitLab.
 - c. A link to your video.
6. **Upload** to OnTrack and **engage with feedback** to get this complete!

Task Requirements

1. GitLab repository

- Create a New Project called Task C1. Set the Visibility Level to **Private**.
- Once the project is created, under **Manage->Members** add the Unit Chair (Aaron Spence) and your OnTrack marking tutor **as a Reporter role**.
- Strictly do not submit your node_modules folder to your repository. To prevent this, create a `.gitignore` file, and add inside it `node_modules/` to prevent this folder from being tracked by Git.

- Commit all code and resources (e.g. images) that you develop for this task into this repository, with proper commit comments.

Failure to follow the above steps means your task cannot be marked as Complete.

2. Post Feature

In Task P4 we redesigned our DEV@Deakin navigation bar like so:

In this task we will develop a Post page. The user can select to submit either a Question or an Article. Your solution must utilise conditional rendering – that is, your user-interface should dynamically adapt depending on which is selected.

To achieve conditional rendering you must utilise React States and React Hooks.

Note that we are not implementing the Post button in this task, but will in a future task. For now, just show a 'Post Received' notification to the user.

3. Design Criteria

Review then implement into your DEV@Deakin web platform the following design criteria – your solution must match *exactly* the same formatting. However, you are free to incorporate your own designs by choosing your own styles (e.g. colours, shading, fonts, etc) and adding additional features/components/media as you wish.

Be sure to implement proper data validation on all data entered by the user, before allowing for a post to be considered successful.

Visit the **Optional Technologies** and **Optional NPM Packages** sections for ideas to enhance your Post form further. For example, the React-Markdown package could be a nice addition!

New PostSelect Post Type: ☒ Question ☐ Article**What do you want to ask or share**

This section is designed based on the type of the post. It could be developed by conditional rendering. For post a question, the following section would be appeared.

Title

Describe your problem

Tags **Post****New Post**Select Post Type: ☐ Question ☒ Article**What do you want to ask or share**

This section is designed based on the type of the post. It could be developed by conditional rendering. For post an article, the following section would be appeared.

Optional Technologies

We strongly encourage you to explore additional technologies that are often standard in industry, that may assist you in completing this task:

- [Zod](#) – An excellent library for data validation, such as usernames, emails and passwords. Robust data validation skills are crucial in industry.
- [TypeScript](#) – Adds 'type safety' to JavaScript. Standard JavaScript is not type-safe, meaning you can store any datatype in any variable which often leads to bugs. Strongly recommended to explore, either within this task or in your own time, and is expected to use within industry.
- [Tailwind CSS](#): A CSS framework where you combine your CSS code with the HTML code. Allows you to design your pages faster.

Know of some awesome technologies? Let us know in the SIT313 Teams channel!

Optional VS Code Extensions

VS Code has a gigantic library of extensions that can improve and speedup the development process. Here are some that may assist you:

- Tailwind CSS IntelliSense by Tailwind Labs – If using Tailwind CSS, this is a must-have extension to enable auto-complete when typing.
- Prettier by prettier.io – Automatically formats your codes' style and structure, to enforce a consistent style throughout.

Optional NPM Packages

There is a rich ecosystem of amazing packages to enhance our development. Here are some that may assist you:

- [React-Markdown](#) – A React component to render Markdown.
- [SweetAlert2](#) – Beautiful, responsive, easy-to-use user popups.
- [React-Toastify](#) – Nice and easy user notifications.

Know of some awesome NPM packages? Let us know in the SIT313 Teams channel!

Caution: Beware of malicious NPM packages!

Unfortunately, NPM packages are now an active area infiltrated by malicious actors. NPM packages may appear 'safe' at glance, but may have embedded malicious code. Before installing any NPM package, investigate whether it is from a trustworthy author(s).

You are responsible for your own cyber-safety.

Available Resources

We have many resources to assist in your learning journey – if you are ever unsure then please reach out to us, we are always happy to help.

- **The SIT313 Teams channel** – an active learning resource with weekly announcements from the Unit Chair, and regular discussions/assistance from the SIT313 teaching team and students.
- **Seminars** – you can attend both on-campus and online sessions, and join as many as you like each week. Your tutors will provide demonstrations and assistance to help guide your learning.
- **SIT313 CloudDeakin** – contains a large collection of text and video resources.
- **Announcements** - Keep an eye on your email and any announcements made in the SIT313 Teams channel.

Caution: Acceptable use of Artificial Intelligence

It is acceptable to use AI as a learning tool. However, you can **never** ask AI to write code to complete some/parts of this task for you: this is cheating because it does not demonstrate that you understand anything. Detection of inappropriate use of

AI has a very real consequences, such as failing the task, or even failing the entire unit.
